

IN THE CLAIMS:

Please amend claims 39, 45, 52, and 53 as follows.

39. (Currently Amended) An image forming apparatus for forming an image in accordance with control codes, said image forming apparatus comprising:

a printing unit for printing an image;

a memory for storing the control codes to control said image forming apparatus having said printing unit;

display means for displaying messages associated with an image forming operation;

receiving means for receiving, from an external apparatus, rewrite execution codes, which are adapted to execute rewriting of the control codes in said memory, in accordance with transfer control codes which are adapted to control transfer of the rewrite execution codes from the external apparatus, and receiving, from the external apparatus, new control codes; and

rewriting means for rewriting the control codes, which have been stored in said memory, with the new control codes received by said receiving means, in accordance with the rewrite execution codes received by said receiving means; and

determination means for, after a power supply is turned on, determining whether rewriting of the control codes has suspended or failed,

~~wherein said display means displays a message informing a user of the fact that the image forming apparatus is under download of data or update of control codes by the rewrite execution codes, instead of displaying copying settings, during execution of the rewrite execution~~

codes if the rewriting of the control codes has suspended or failed, the rewrite execution codes are received from the external apparatus in accordance with the transfer control codes, the new control codes are received from the external apparatus and the control codes are rewritten with the new control codes in accordance with the rewrite execution codes.

40. (Previously Presented) The image forming apparatus according to Claim 39, wherein the rewrite execution codes are transferred to a nonvolatile memory medium as said memory and stored therein.

41. (Previously Presented) The image forming apparatus according to Claim 39, wherein the rewrite execution codes include address information of said memory for executing rewriting of the control codes, and said rewriting means executes the rewriting of the control codes, which have been stored in said memory, in accordance with the address information.

42. (Previously Presented) The image forming apparatus according to claim 39, further comprising:

image forming control means for controlling an image forming process in accordance with the control codes; and

switching means for exclusively changing over whether the image forming process is executed by said image forming control means or whether rewriting of the control codes is executed by said rewriting means.

43. (Previously Presented) The image forming apparatus according to claim 42, wherein said switching means exclusively changes over using a predetermined switch whether the image forming process is executed by said image forming control means or whether the rewriting of the control codes is executed by said rewriting means.

44. (Previously Presented) The image forming apparatus according to claim 42, wherein said switching means exclusively changes over in accordance with a predetermined command from said external apparatus whether the image forming process is executed by said image forming control means or whether the rewriting of the control codes is executed by said rewriting means.

45. (Currently Amended) An image forming apparatus for forming an image in accordance with control codes, said image forming apparatus comprising:

a printing unit for printing an image;

a code memory for storing control codes which are adapted to control the image forming apparatus having said printing unit; and

a processor for controlling the image forming apparatus in accordance with the control codes stored in said code memory,

wherein, after a power supply is turned on, said processor determines whether rewriting of the control codes has suspended or failed, and if the rewriting of the control codes has suspended or failed, said processor controls transfer of the rewrite execution codes, which are adapted to execute rewriting of the control codes from an external apparatus, said processor

controls transfer of new control codes from the external apparatus, and said processor controls the rewriting of the control codes, which have been stored in said code memory, with the new control codes transferred from the external ~~apparatus, apparatus, and~~ in accordance with the rewrite execution codes transferred from the external apparatus.

~~an informing unit for informing a user of the fact that the image forming apparatus is under download or update of control codes by the rewrite execution codes, instead of for displaying copying settings.~~

46. (Previously Presented) The image forming apparatus according to Claim 45, wherein said processor controls transfer of the rewrite execution codes in accordance with transfer control codes which are adapted to control transfer of the rewrite execution codes from the external apparatus.

47. (Previously Presented) The image forming apparatus according to Claim 45, wherein said code memory is a rewritable memory.

48. (Previously Presented) The image forming apparatus according to Claim 45, wherein the image forming apparatus is a copying machine or a printer.

49. (Previously Presented) The image forming apparatus according to Claim 45, wherein the rewrite execution codes include address information of said code memory and said

processor controls rewriting of the control codes with the new control codes transferred from the external apparatus in accordance with the address information.

50. (Previously Presented) The image forming apparatus according to Claim 45, wherein said processor exclusively changes over control of an image forming process and rewriting the control codes.

51. (Cancelled)

52. (Currently Amended) A rewrite control method for rewriting control codes, which have been stored in a memory and are adapted to control an image forming apparatus having a printing unit to form an image, said rewrite control method comprising:

a displaying step of displaying messages associated with an image forming operation;

a receiving step of receiving, from an external apparatus, rewrite execution codes, which are adapted to execute rewriting of the control codes in the memory, in accordance with transfer control codes which are adapted to control transfer of the rewrite execution codes from the external apparatus, and receiving, from the external apparatus, new control codes; ~~and~~

a rewriting step of rewriting the control codes, which have been stored in the memory, with the new control codes received in by said receiving step, in accordance with the rewrite execution codes received by said receiving step; and

a determination step of, after a power supply is turned on, determining whether rewriting of the control codes has suspended or failed,

~~wherein a message informing a user of the fact that the image forming apparatus is under download or update of control codes by the rewrite execution codes is displayed, instead of displaying copying settings~~ if the rewriting of the control codes has suspended or failed, the rewrite execution codes are received from the external apparatus in accordance with the transfer control codes, the new control codes are received from the external apparatus, and the control codes are rewritten with the new control codes in accordance with the rewrite execution codes.

53. (Currently Amended) A rewrite control method for rewriting control codes, which have been stored in a code memory and are adapted to control an image forming apparatus having a printing unit to form an image, said rewrite control method comprising:

a first control step of controlling transfer of rewrite execution codes, which are adapted to execute rewriting of control codes from an external apparatus;

a second control step of controlling transfer of new control codes from the external apparatus;

a third control step of, after a power supply is turned on, said processor determines whether rewriting of the control codes has suspended or failed, and if the rewriting of the control codes has suspended or failed controlling the rewriting of the control codes, which have been stored in the said code memory, with the new control codes transferred from the external ~~apparatus, apparatus;~~ and in accordance with the rewrite execution codes transferred from the external apparatus.

~~an informing step of informing a user of the fact that the image forming apparatus is under download or update of control codes by the rewrite execution codes, instead of displaying copying settings.~~

54. (Cancelled)
